## NOTES ON BIRTHS.

In the year 1912, 16,583 births were registered in the State, including stillbirths, (14,082 in 1892, 14,604 in 1893, 14,607 in 1894, 15,430 in 1895, 15,429 in 1896, 15,142 in 1897, 15,121 in 1898, 14,475 in 1899, 14,709 in 1900, 14,615 in 1901, 15,166 in 1902, 15,130 in 1903, 15,405 in 1904, 16,005 in 1905, 16,585 in 1906, 16,595 in 1907, 16,914 in 1908, 16,735 in 1909, 16,469 in 1910, and 16,300 in 1911).

The number of living children born was 15,869, and the number of stillbirths was 714.

Of the whole number of living children of which the sex was certified, 8,200 were males and 7,664 were females. In 5 births, the sex was not stated. For each 100 girls born there were 106.9 boys (106.7 in 1892, 107.4 in 1893, 104.7 in 1894, 106.4 in 1895, 105.3 in 1896, 102.3 in 1897, 106 in 1898, 104.4 in 1899, 103.2 in 1900, 105.6 in 1901, 105 in 1902, 105.3 in 1903, 104.2 in 1904, 104.1 in 1905, 106 in 1906, 104.3 in 1907, 107.2 in 1908, 104.7 in 1909, 103.8 in 1910, and 105.5 in 1911).

*Birth-rate.*—The birth-rate of living children for the State was 21.27 for each 1,000 of population.

Table No. 12 shows the number of births in each city with the birth-rate of each. The average birth-rate in the cities per 1,000 population was 21.00 as compared with 21.16, the birth-rate of the rest of the State.

The birth-rate of the different counties varied widely. As it invariably has been every year since the registration began, it was the highest in Aroostook, 31.94, and the lowest in Knox, 15.20. In three counties, Aroostook, Oxford, and Somerset, the birth-rate was above that of the whole State. The birth-rate in each county is shown in Tables No. 3 and 7.

*Parentage.*—Of the total births in the State, 60.24 per cent. were of native parents, 19.32 per cent. were of foreign parentage; 19.39 per cent. were of parents one of whom was foreign; while in 1.11 per cent., the nationality was not stated.

Lincoln county had the largest percentage of native-born parents, to wit, 89.59 per cent., and only 2.28 per cent. in which both parents were foreign-born. Waldo followed with 89.14 per cent. of native parentage, and only 3.28 per cent. in which both parents were foreign-born.

In Hancock county in 87.70 per cent. of the births the parents were native-born, and in 2.97 per cent., foreign-born.

In Knox county the percentage of native-born parents was 75.92; in Sagadahoc, 68.81; in Franklin, 68.16; in Piscataquis, 67.39; in Somerset, 65.63; and in Washington, 65.69.

Comparatively high percentages of foreign-born parents are found in York county, 32.94; in Androscoggin, 32.70; in Oxford, 30.38; and in Cumberland, 25.63.

The percentages of parentage, whether American-born or foreign-born, may be found for the other counties in Table No. 13.

Comparing the percentage of the births in our twenty cities with that of the rest of the State, we find that in the cities 46.38 per cent. of the births were of American parentage, while in the rural parts of the State the percentage of American-born children was 67.09.

The largest percentage of foreign-born parents was in Biddeford, 59.96; and in Lewiston 43.10.

There were no births in Ellsworth in which both parents were foreign-born. For further comparisons see Table No. 14.

*Seasons and Births.*—The largest number of births in any one month in 1912 was 1,451 in May; the smallest was 1,179 in December; the largest quarterly total was 4,199 in the third quarter; the smallest, 3,590 in the last quarter. The three consecutive months in which the largest number of births occurred were May, June and July, 4,230.

The following is a tabular statement of the number of births in each month of the twenty-one years, 1892-1912:

## NOTES ON DEATHS AND THE CAUSES OF DEATHS.

The number of deaths registered in the year 1912 was 11,390. This was 341 less than for the preceding year 1911. Table No. 27 exhibits the total number of deaths which occurred in each month of the years 1905-1912. The number of deaths for 1912 in each month by counties is shown in Table No. 34.

*Sex and Mortality.*—Of the 11,390 decedents, 5,865 were males and 5,523 were females, and two were not stated.

Among children dying before they were 5 years old, 1,067 were males and 861 were females; there were 206 more deaths among boys under 5 years of age than among girls within the same age-period. At the age-periods from 5 to 80 years, there was also a preponderance of deaths among males, but from 80 to 100, more among females. At the age of 100 years and over, one man and seven women died. See table No. 34.

*Age and Mortality.*—The following shows the number of deaths which occurred within each age-period, and the relation which the percentage in each period bears to the whole number of deaths:

Under	1	year of age	1,465	12.87 per cent.
From	1-5	years of age	464	4.07 per cent.
From	5-10	years of age	188	1.65 per cent.

*The Causes of Death.*—Compared with 1911, among the chief causes of death there were in 1912, 90 more from cancer, 34 more from pneumonia, 30 more from measles, 20 more from diphtheria and croup, 10 more from diseases of nervous system, 7 more from rheumatism, 1 more from bronchitis and 1 more from scarlet fever.

On the other hand there were 180 less from diarrheal diseases, 107 less from influenza, 73 less from nephritis and

Bright's disease, 59 less from tuberculosis, 56 less from diseases of heart, 33 less from typhoid fever, 25 less from diabetes, and 23 less from whooping cough.

The next table gives a cursory view of the relative mortality in 1911 and 1912 from some of the leading causes of death.

The various diseases of the brain have occupied the first place among the causes of death, except in 1892, when pneumonia had the first place, and consumption was the next most prominent cause until 1898 when it was reduced to the third place in the list; and in 1899 and 1900 it occupied the fourth place; in 1901, the third place; in 1902, 1903, 1904, 1905, 1906, 1907, 1908, 1909, 1910, and 1911 it occupied the fourth place while this year it has declined to the fifth place. Diseases of the heart have the second place. and pneumonia has the third place.

† Including deaths certified as from nephritis and Bright's disease.

By referring to Table No. 29 it will be noticed that the causes of death are arranged by counties under fourteen classes. The following notes on some of the classes and individual causes of death will be arranged in accordance with the classification shown in this Table No. 29.

*Infectious Diseases.*—The lists of the infectious diseases usually include smallpox, measles, scarlet fever, typhoid fever, whooping cough, diphtheria and croup. The following table shows the number of deaths which resulted from these diseases in the several counties of the State:

*Typhoid Fever.*—There were 102 deaths from typhoid fever. Of these, 61 were males and 41 were females. As indicative of the loss which the State incurs from typhoid fever, it is well to bear in mind that the age distribution of the decedents shows that the deaths from this disease are principally among those active and productive age-periods when human life is of the most value; 73 per cent. died between 10 and 50 years of age.

Ages: 1-5, 3; 5-10, 8; 10-20, 20; 20-30, 23; 30-40, 19; 40-50, 12; 50-60, 12; 60-70, 3; 70-80, 2.

The largest number of deaths, 15, occurred in January, and the smallest number, 4, in July. By quarters, 30 were in the first quarter, 21 in the second, 26 in the third, and 25 in the last quarter of the year.

The typhoid death-rate of 1.88 in the cities is much greater than that in the villages and rural towns, which is 1.10. The rate for the State is 1.35.

The following exhibits the number of deaths from typhoid fever in each county, by months, with death-rate in each county.

*Malarial Diseases.*—About every year a few deaths have been reported to the department as having been caused by malaria, or malarial disease. Almost without exception when there was good reason to believe that the deaths had malarial cause, the infection was contracted outside the State. For the year 1910, no deaths were reported as having been caused by malaria, for 1911 only 3, and only 2 reported for this year.

*Cerebral Tuberculosis.*—(Tubercular Meningitis.)—The number of deaths was 76; 30 were of males and 46 of females.

The number for the cities was 28. The death-rate for the State was 1.01; for the cities 1.12.

Ages: Under 1, 14; 1-5, 24; 5-10, 6; 10-20, 13; 20-30, 6; 30-40, 5; 40-50, 3; 50-60, 5.

*Pulmonary Tuberculosis.*—(Consumption.)—From this cause 780 deaths were registered in 1912, which is equivalent to a death-rate of 10.37 per 10,000 of population. The death-rate for the cities was 12.97. The following is a tabular arrangement of the number of deaths in the State from pulmonary tuberculosis in each of the twenty-one registration years, together with the death-rate from consumption for each year:

There were in 1912, 572 fewer deaths than in 1892, 519 fewer than in 1893, 482 fewer than in 1894, 415 fewer than in 1895, 392 fewer than in 1896, 348 fewer than in 1897, 241 fewer than in 1898, 235 fewer than in 1899, 247 fewer than in 1900, 253 fewer than in 1901, 190 fewer than in 1902, 121 fewer than in 1903, 236 fewer than in 1904, 114 fewer than in 1905, 135 fewer than in 1906, 170 fewer than in 1907, 113 fewer than in 1908, 50 fewer than in 1909, 109 fewer than in 1910, and 62 fewer than in 1911.

Ages: Under 1, 8; 1-5, 14; 5-10, 6; 10-20, 91; 20-30, 212; 30-40, 164; 40-50, 88; 50-60, 69; 60-70, 76; 70-80, 35; 80 and over, 17.

It is thus shown in this report, that the smallest number of deaths occurred at the age-period 5-10 years, and that of the decedents, 71 per cent died at those ages when their deaths entailed the greatest loss to the State.

As to the sex, 392 of the decedents, or 50.3 per cent., were males; and 388, or 49.7 per cent., were females.

The following table shows the number of deaths in each county by months, with the death-rate from consumption in each county:
